Relaxation Exercises

The ability to fully relax and calm one's mind and body is crucial and is the foundation of any program undertaken to overcome anxiety, phobias, panic, and stress-related disorders. Relaxation is more than just sitting in front of the TV or in a warm bath. These activities may be relaxing, but they don't make as profound a difference in managing anxiety as regular, daily, active, deep muscle relaxation. As stated in *The Anxiety and Phobia Workbook* by Edmond J. Bourne, PhD: "Deep relaxation refers to a distinct physiological state that is the exact opposite of the way your body reacts under stress or during a panic attack. (Relaxation) involves a series of physiological changes including the following:

- Decrease in heart rate
- Decrease in respiration rate
- Decrease in blood pressure
- Decrease in skeletal muscle tension
- Decrease in metabolic rate and oxygen consumption
- Decrease in analytical thinking
- Increase in skin resistance
- Increase in alpha wave activity in the brain

Regular practice of deep relaxation for 20-30 minutes on a daily basis can produce over time, a generalization of relaxation to the rest of your life. That is, after several weeks of practicing deep relaxation once per day, you will tend to feel more relaxed all the time."

Dr. Bourne goes on to state that "Numerous other benefits of deep relaxation have been documented over the past 20 years. These include [the following]:

- Reduction of generalized anxiety and frequency and severity of panic attacks
- Preventing stress from becoming cumulative
- Increased energy level and productivity
- Improved concentration and memory
- Reduction of insomnia and fatigue
- Prevention and/or reduction of psychosomatic disorders such as hypertension, migraines, headaches, asthma, ulcers, etc.
- Increased self-confidence and reduced self-blame. For many people, stress and excessive self-criticism or feelings of inadequacy go hand in hand. You can perform better, as well as feel better, when you are relaxed.
- Increased availability of feelings. Muscle tension is one of the chief impediments to an awareness of your feelings."

We have found that *The Anxiety and Phobia Workbook* is a tremendous resource for further information about relaxation, stress management and numerous other practices to help people feel better overall.
The counseling staff at Ozarks Technical Community College (417-447-6974) has recorded several relaxation exercises that can be accessed and downloaded directly from our webpages. These are very basic breathing, muscle relaxation and visualization exercises. They have been chosen to give an introduction to relaxation practice as listeners begin working on issues related to an inability to fully relax (test anxiety, stress related symptoms, difficulty sleeping, panic disorder). We encourage listeners to read through the following scripts to get an idea of the simplicity of these exercises and then take a listen! Please also know that you may also wish to pick up a much wider variety of recorded relaxation exercises at local retailers. There are so many different forms of relaxation and there may be ones that work better for you than others. No matter what you prefer, DO SOMETHING toward making relaxation a regular part of your daily life.

When doing any relaxation exercise, be sure to do the following:

1. Find a quiet location, where you won't be distracted for the full length of your relaxation practice.
2. Initially, you will need to practice relaxation every day for at least twenty minutes per day.
3. When possible, practice on an empty stomach since relaxation can be disrupted by food digestion.
4. Get into a comfortable position. You do not have to lie down, but you do want to be sure that your whole body is supported and that you have ample space to move all parts of your body.
5. Loosen tight fitting clothing.
6. "Assume a passive, detached attitude." "Be here now." If your mind wanders, gently bring it back to the here and now.
Deep Abdominal Breathing Exercises

1. Become aware of the level of tension you're feeling in your body. Place one hand on your abdomen right beneath your rib cage.
2. Inhale slowly and deeply through your nose into the "bottom" of your lungs---in other words, send the air as low down as you can. If you're breathing from your abdomen, your hand should actually rise and your chest should move only slightly. Another way to think of it is "belly breathing" or "happy baby breathing."
3. When you've taken in a full breath, pause for several seconds and then exhale SLOWLY through your nose or mouth, depending on your preference. Be sure to exhale fully.
4. As you exhale, allow your whole body to just let go (you might visualize your arms and legs going loose and limp like a rag doll).
5. Complete ten slow, full, abdominal breaths. Try to keep your breathing smooth and regular, without gulping in a big breath or letting your breath out all at once. Remember to pause briefly at the top of each inhalation and let air out slowly with each exhalation. If you start to feel light-headed while practicing abdominal breathing, stop for thirty seconds, and then start up again.
6. Extend the exercise if you wish by doing two or three "sets" of abdominal breaths, striving to count up to ten for each set. Five full minutes of abdominal breathing will have a pronounced effect in reducing anxiety or early symptoms of panic.

Another short exercise you may wish to try is the following breathing/visualization exercise:

"Think about your breathing. Notice the passage of air through your nose, into your lungs, the swelling of your chest. Forget all else; consider only the air and the quiet. As you breathe out, feel the air flow gently over your lips; imagine it moving a feather softly and gently. You are your breathing, forget all else. Concentrate on the breath moving easily in and out. You have nothing to do but breathe, and feel the air refreshing you."
**Progressive Muscle Relaxation**

1. If you are doing the progressive muscle relaxation exercise separate from the deep breathing exercise above, please begin by taking three, deep abdominal breaths, exhaling slowly each time. As you exhale, imagine that tension throughout your body begins to flow away.

2. Clench your fists. Hold (7-10 seconds) and then release (15-20 seconds). (Use these same time intervals for all other muscle groups. When tightening a particular muscle group, do so vigorously, without straining. When you release your muscle group, do so abruptly and feel the sensation of relaxation in that particular muscle group).

3. Tighten your biceps by drawing your forearms up toward your shoulders and "making a muscle" with both arms. Hold and then relax.

4. Tighten your triceps - the muscles on the undersides of your upper arms - by extending your arms out straight and locking your elbows. Hold and then relax.

5. Tense the muscles in your forehead by raising your eyebrows as far as you can. Hold and then relax. Imagine your forehead muscles becoming smooth and limp as they relax.

6. Tense the muscles around your eyes by clenching your eyelids tightly shut. Hold and then relax. Imagine sensations of deep relaxation spreading all around the area of your eyes.

7. Tighten your jaws by opening your mouth so widely that you stretch the muscles around the hinges of your jaw. Hold and then relax. Let your lips part and allow your jaw to hang loose. Loosen your tongue from the roof of your mouth.

8. Tighten the muscles in the back of your neck by pulling your head way back, as if you were going to touch your head to your back (be gentle with this muscle group to avoid injury). Focus only on tensing the muscles in your neck. Hold and then relax. Since this area is often especially tight, plan to do this tense-relax sequence again. Tighten the muscles in the back of your neck by pulling your head way back, as if you were going to touch your head to your back. Hold and then relax.

9. Take a few, deep, abdominal breaths and tune in to the weight of your head sinking into whatever surface it is resting on.

10. Tighten your shoulders by raising them up as if you were going to touch your ears. Hold and then relax.

11. Tighten the muscles around your shoulder blades by pushing your shoulder blades back as if you were going to touch them together. Hold the tension in your shoulder blades and then relax. Since this area is often especially tense, plan to do this tense-relax sequence again. Tighten the muscles around your shoulder blades by pushing your shoulder blades back as if you were going to touch them together. Hold the tension in your shoulder blades and then relax.

12. Tighten the muscles of your chest by taking in a deep breath. Hold for ten seconds and then SLOWLY release. Imagine any excess tension in your chest flowing away with the exhalation.

13. Tighten your stomach muscles by sucking your stomach in. Hold and then release. Imagine a wave of relaxation spreading through your abdomen.

14. Tighten your lower back by arching it up. (you can omit this exercise if you have lower back pain). Hold and then relax.

15. Tighten your buttocks by pulling them together. Hold and then relax.
16. Squeeze the muscles in your thighs by pressing your upper legs together, all the way down to your knees. Hold and then relax. Feel your thigh muscles smoothing out and relaxing completely.
17. Tighten your calf muscles by pulling your toes toward you (flex carefully to avoid cramps). Hold and then relax.
18. Tighten your feet by curling your toes downward. Hold and then relax.
19. Mentally scan your body for any residual tension. If a particular area remains tense, repeat one or two tense-relax cycles for that group of muscles.
20. Now imagine a wave of relaxation slowly spreading throughout your body, starting at your head, and gradually penetrating every muscle group all the way down to your toes.

**Visualization**

"Visualization is a method of deliberately using imagery to modify your behavior, the way you feel, and even your internal physiological state."

The best time to practice visualization is when you are in a deeply relaxed state. It is at this time that one is able to really "see" the imagery of the visualization. Visualization can be used, however, at any time that you are beginning to feel anxious. It can be a wonderful tool to help you get yourself out of a negative or self-defeating mental preoccupation.

The following visualization is taken directly from "The Anxiety and Phobia Workbook." There are lots of different "scenes" that can be used for a visualization, so if this one is not meaningful enough for you, try making your own or searching the book store for more visualization ideas.

"You're walking along a path deep in the forest. All around you there are tall trees, pine, fir, redwood, and oak, try to see them. The rushing sound of the wind blowing through the treetops is so soothing, allowing you to let go. You can smell the rich dampness of the forest floor, the smell of earth and new seedlings, and rotting leaves. Now you look up through the treetops until you can see a light blue sky. You notice how high the sun is in the sky. As the sun enters the canopy of the treetops, it breaks into rays that waft their way down through the trees to the forest floor. You're watching the intricate patterns of light and shadow created as the light filters down through the trees. The forest feels like a great primeval cathedral, filling you with a sense of peace and reverence for all living things.

Off in the distance, you can hear the sound of rushing water echoing through the forest. It gets louder as you approach, and before long, you are at the edge of a mountain stream. You're looking at the stream, noticing how clear and sparkling the water is. Imagine sitting down and making yourself very comfortable. You might sit down on a flat rock up against a tree or you might even decide to lay down on a grassy slope. You can see the mountain stream creating rapids as it moves, rushing around a variety of large and small rocks. These rocks are many shades of brown, gray, and white, and some are covered with moss. You can see the sparkling water rushing over some and around others, making whirlpools and eddies. The rushing sound of the water is so peaceful that you can just let yourself drift, relaxing more and more."
You take in a deep breath of fresh air and breathe out, finding the subtle smells of the forest very refreshing. As you let yourself sink into the soft bed of grass or dead leaves, or fragrant pine needles beneath you, you can let go of any strains or concerns, allowing the sights, sounds, and smells of this beautiful wooded area to fill you with a deep sense of peace."

When you have completed your relaxation exercises, it is important to help yourself come back to an alert, wakeful state of mind before resuming your daily activities. The following script can be used to help "bring you back."

"Now, in a moment, you can begin to come back to an alert, wakeful state of mind. Pay attention as I count from one up to five. When I get up to five, you can open your eyes and feel awake, alert, and refreshed. One--gradually beginning to come back up to an alert, wakeful state. Two--more and more awake. Three--perhaps you might move your hands and feet as you become even more alert. Four--almost back to a fully alert state. And five--opening your eyes now, finding yourself fully awake, alert, refreshed and filled with a sense of peace."
